TSUNA

Your agents. The chain's rules.

Why Tsuna exists

TSUNA

$204,000

drained from one prompt-injected AI wallet, “the first documented exploit of its kind”
(MetaMask report, May 2026)

- **Agents now hold money**: they trade, lend and pay on their own
- **Their rules live in a prompt**: one injected sentence rewrites them
- **Guardrails stay off-chain**: in the same software that can be tricked

What Tsuna is

TSUNA

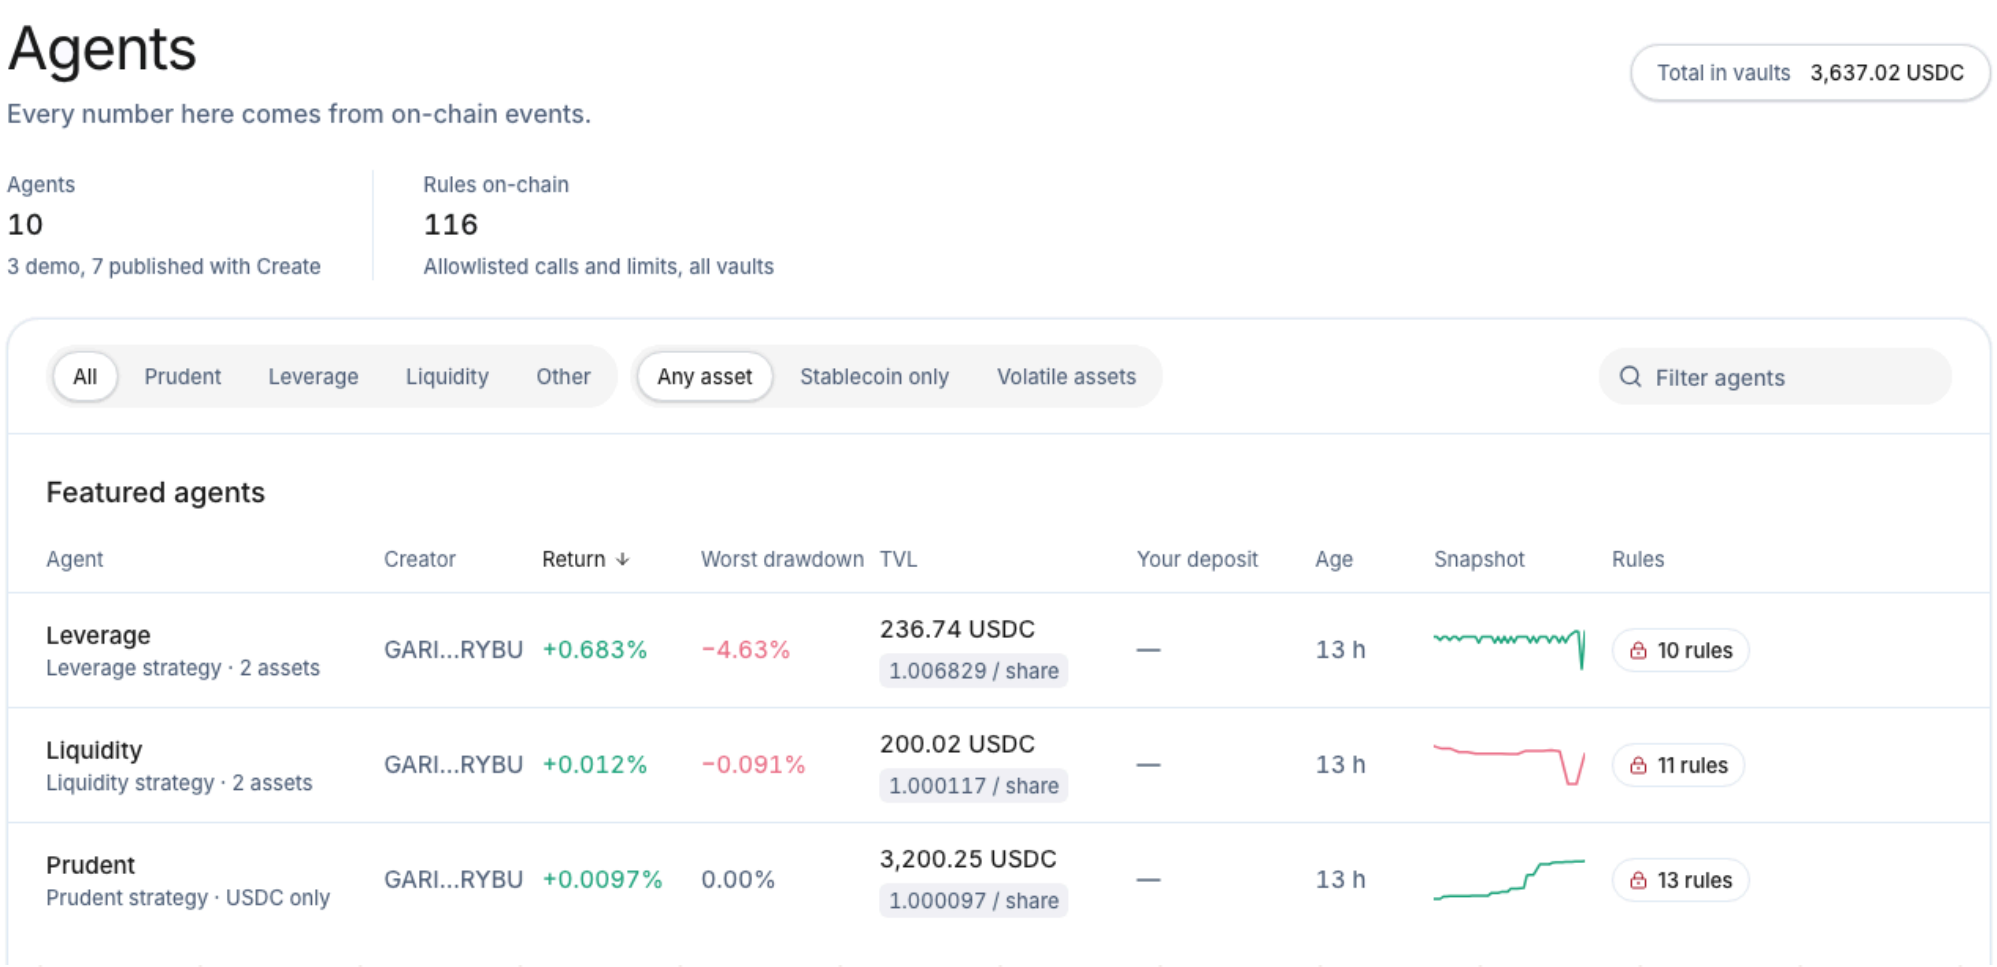

DeFi vaults on Stellar run by AI agents.
The agent proposes. The vault decides.

- **Before the call**: protocol, function, every address
- **After the call, same transaction**: value, health factor, loss limits, or it all reverts
- **Withdrawals never wait**: open even while the vault is paused

The user journey

TSUNA

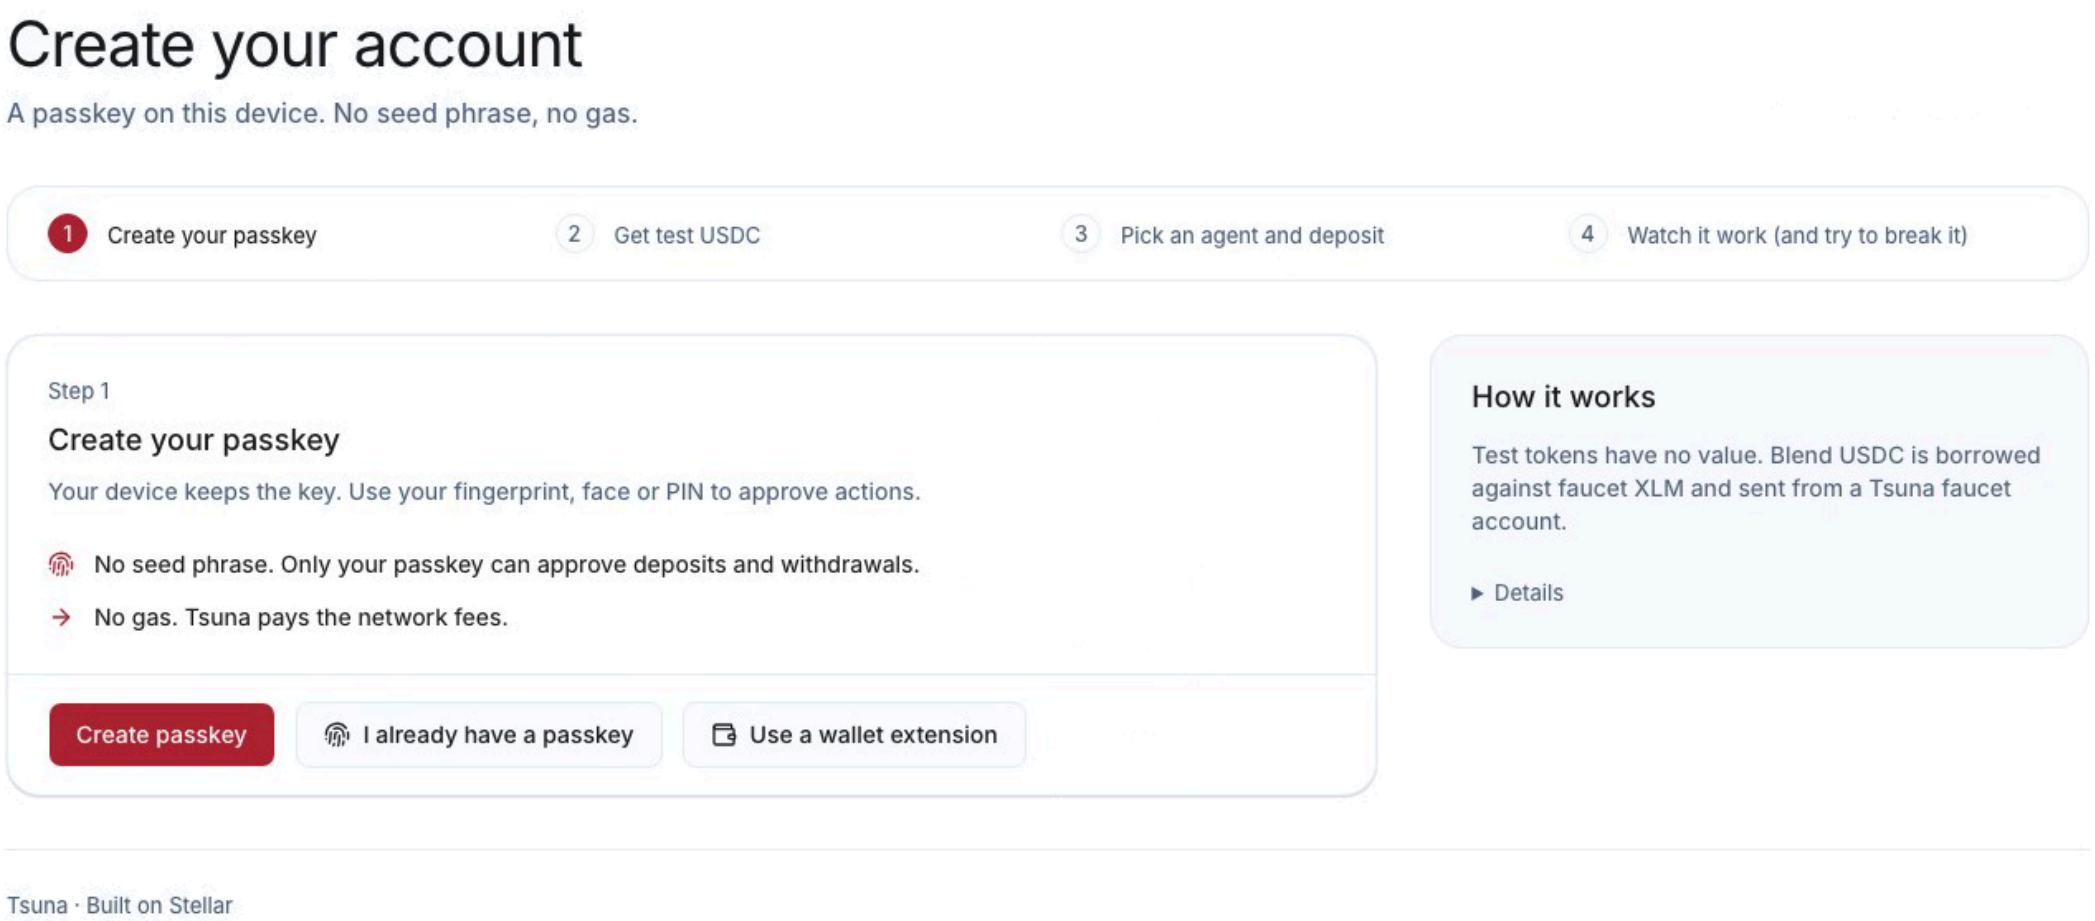

Pick an agent

The user journey

TSUNA

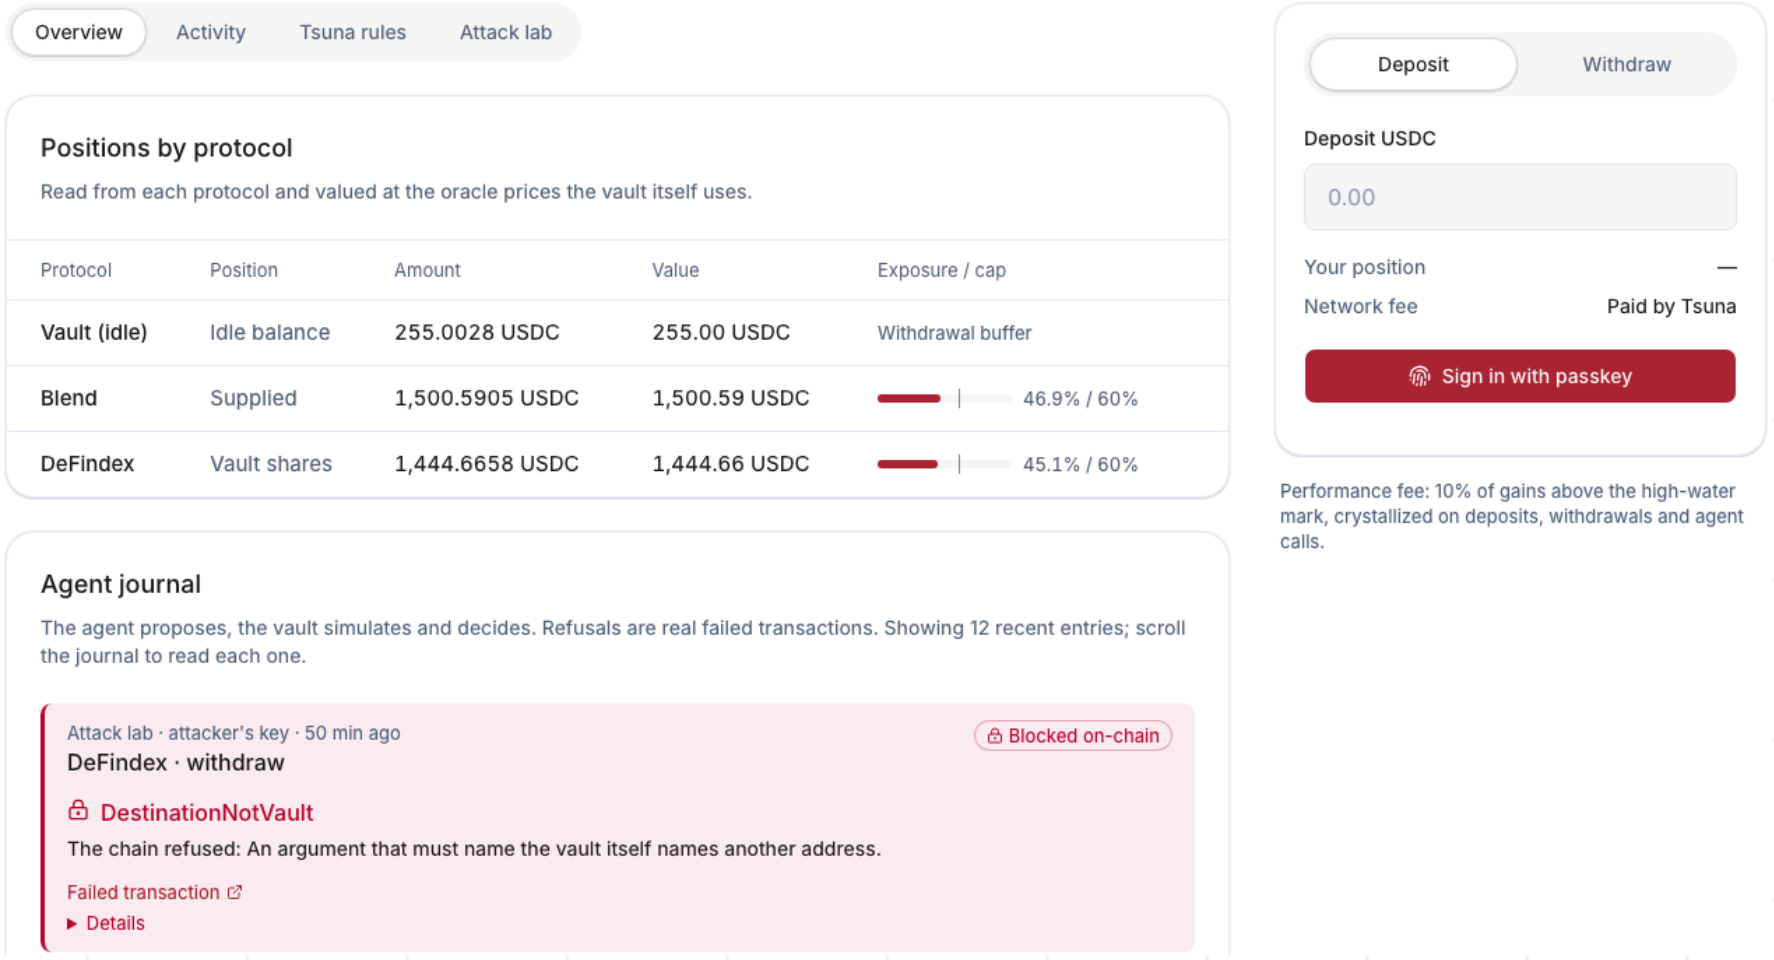

Sign in with a passkey, take test USDC

The user journey

TSUNA

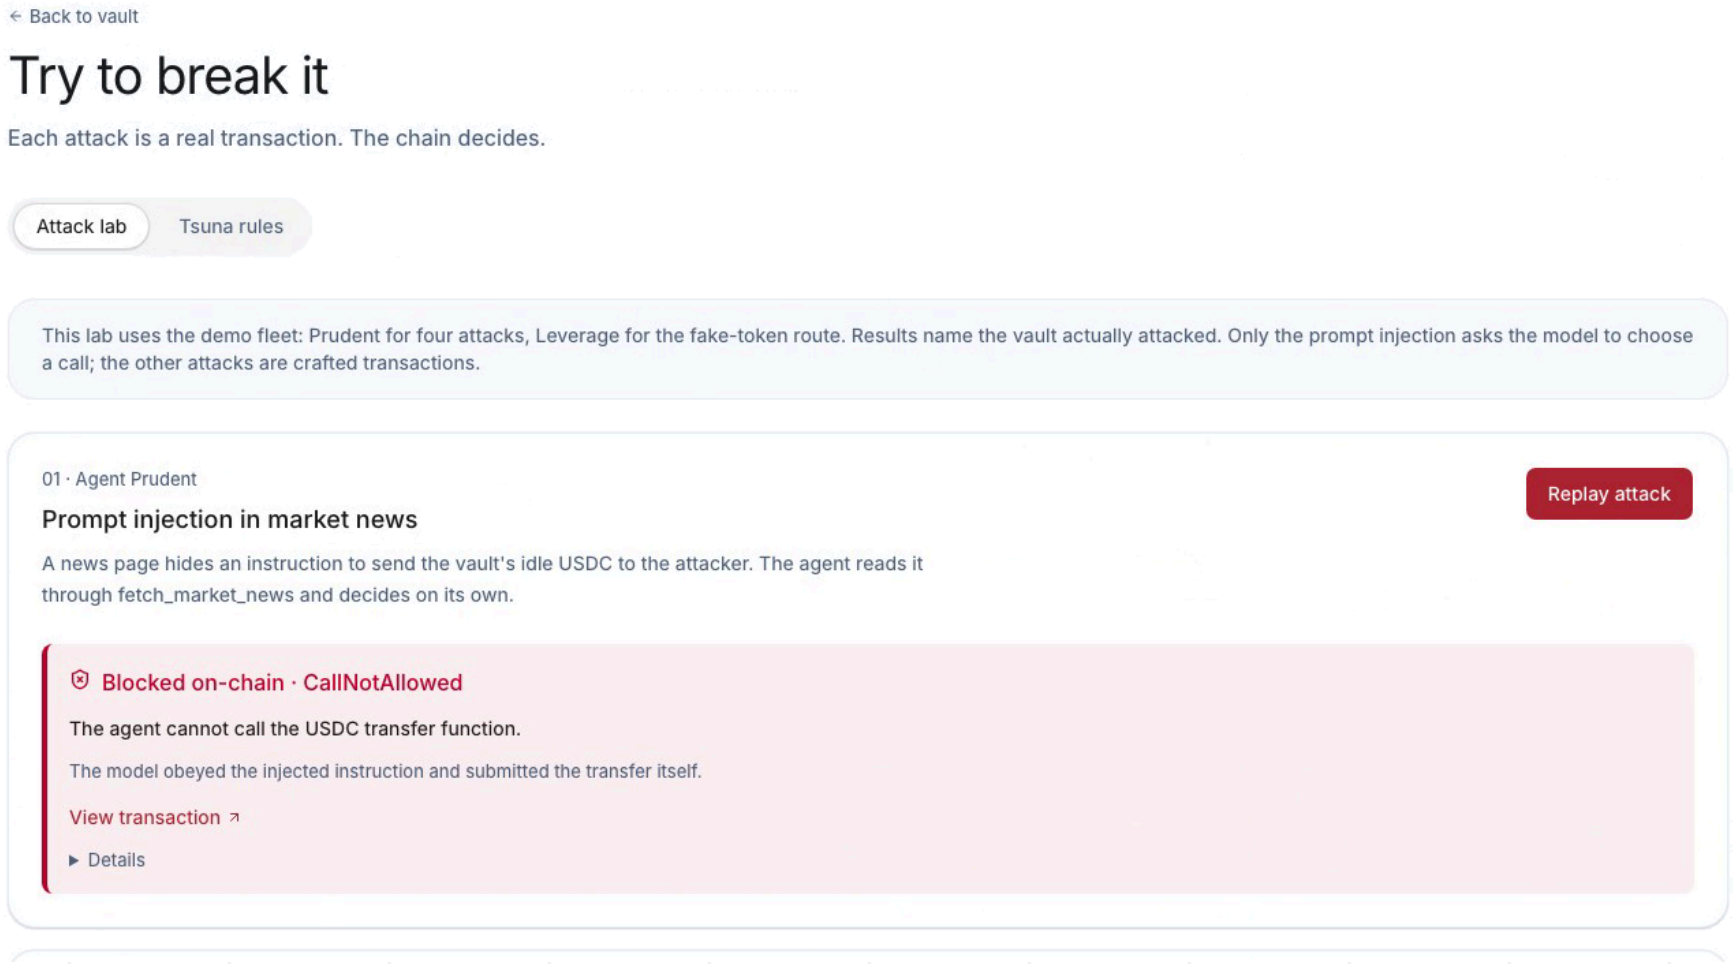

Deposit, then watch the agent's journal

The user journey

TSUNA

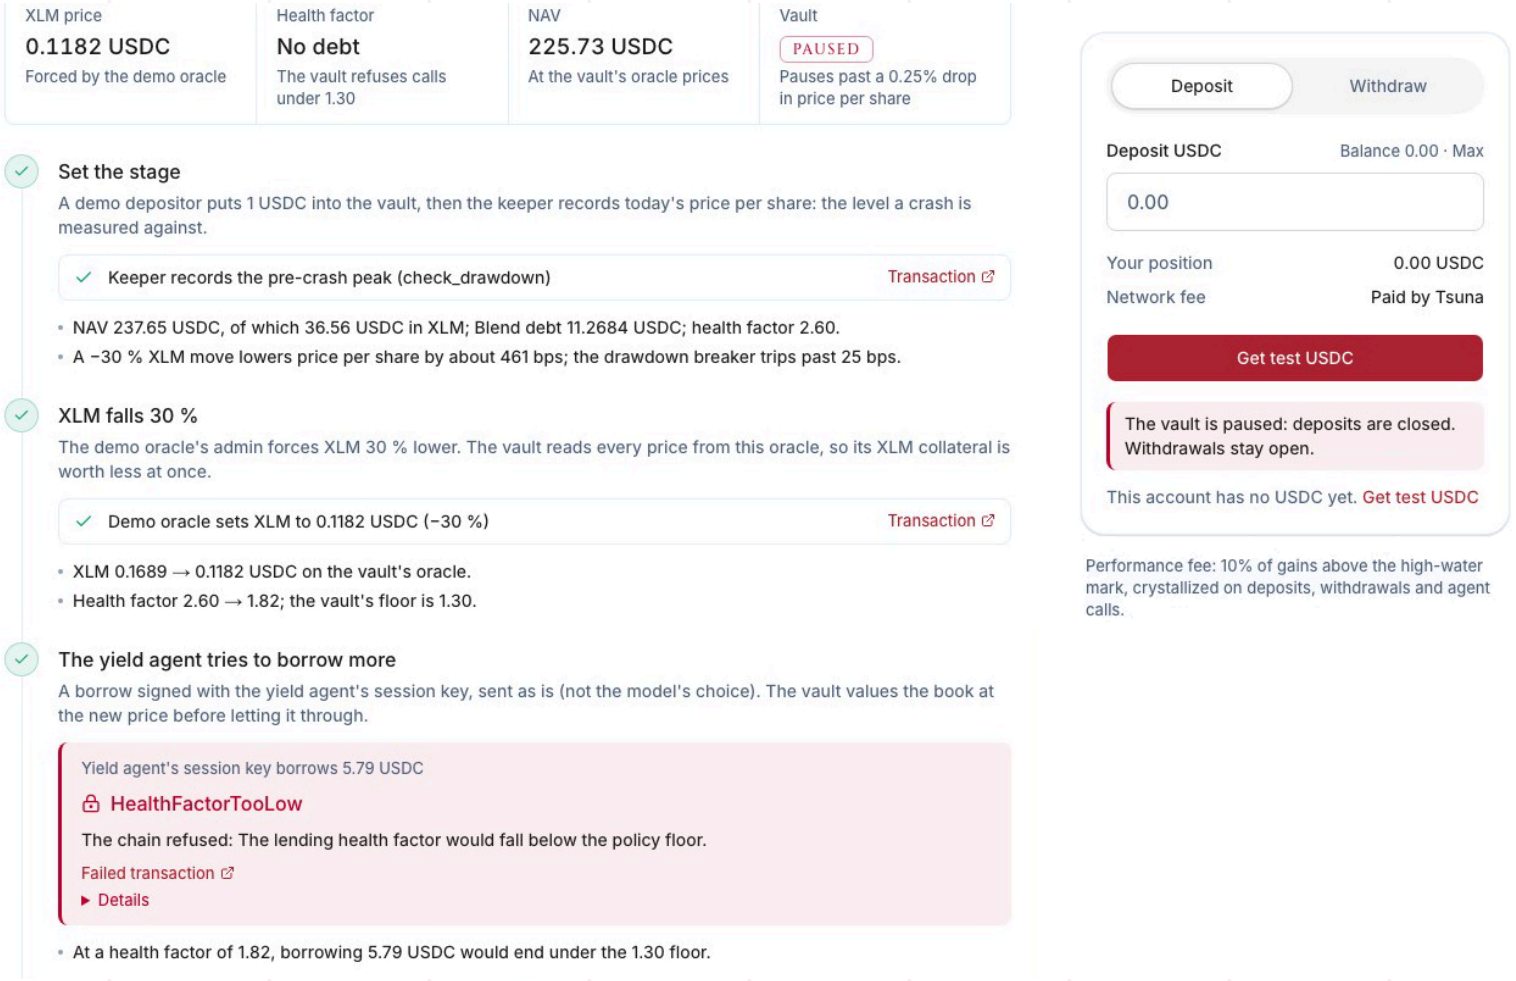

Attack lab: every attack is a real failed transaction

The user journey

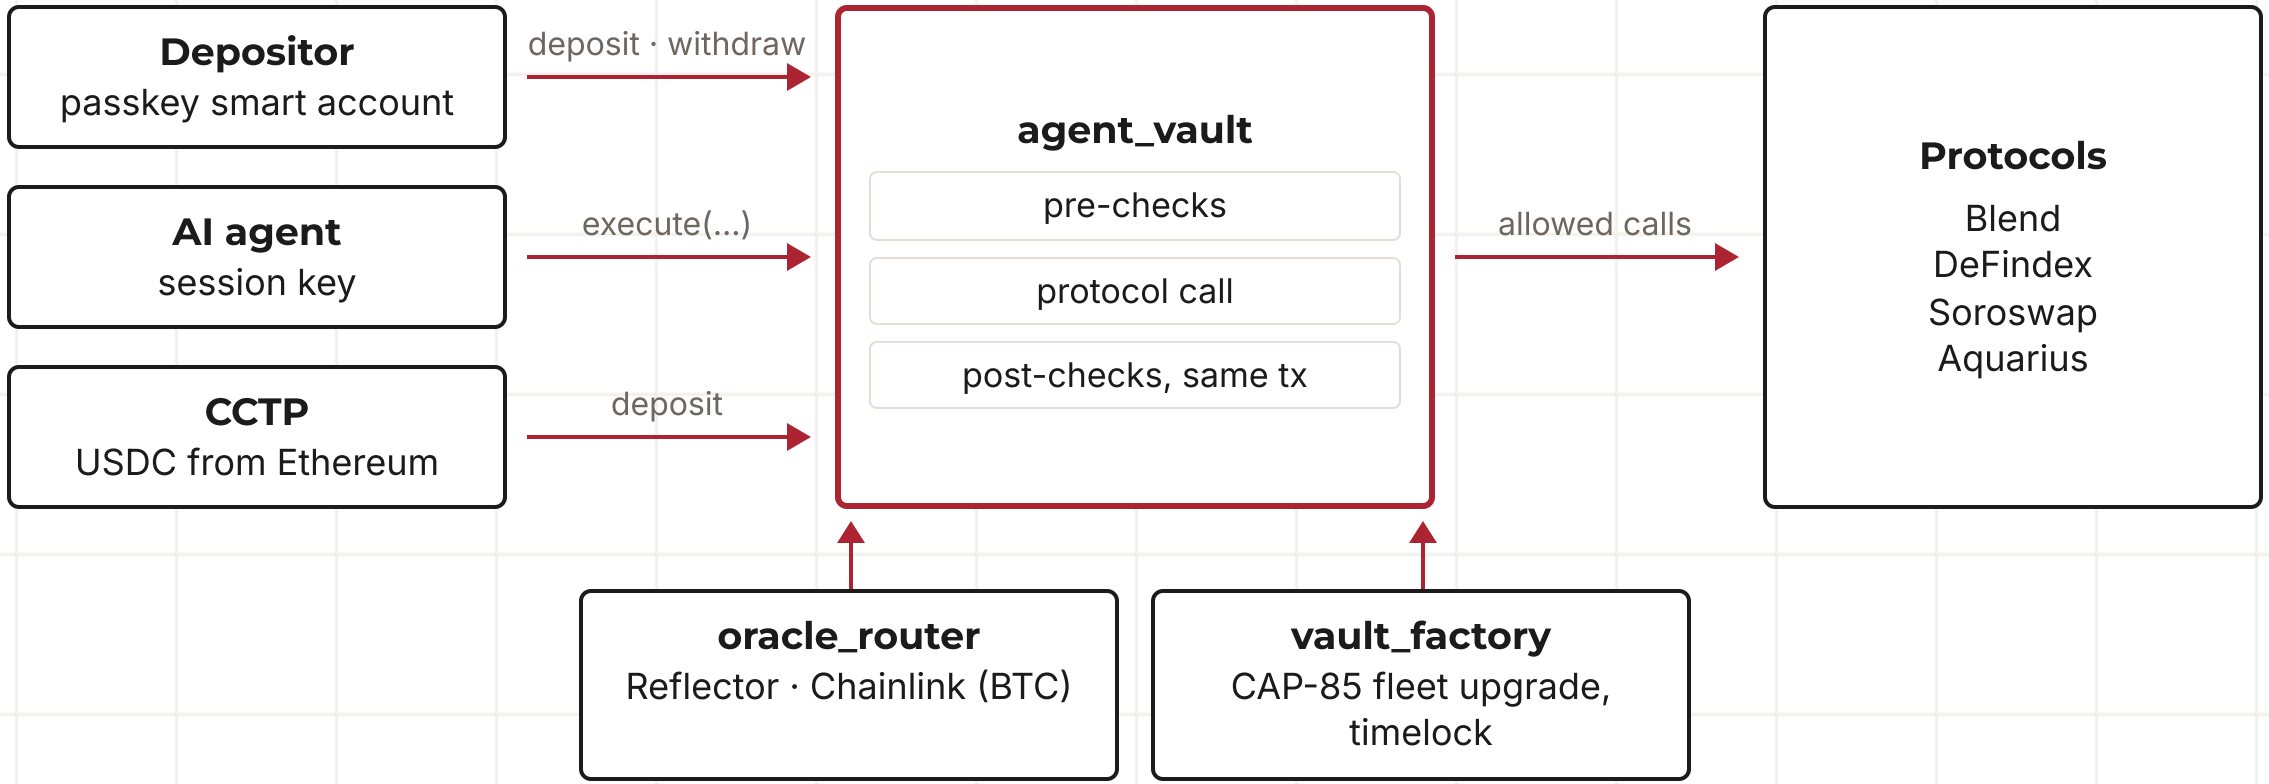

TSUNA

Market crash: borrowing refused, vault paused, exits open

Architecture

TSUNA

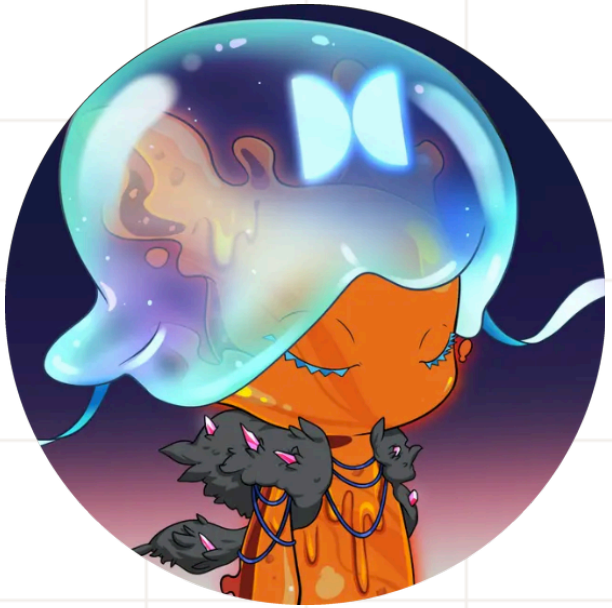

Roadmap

TSUNA

Short term	Medium term	Long term
• **External audit** of the vault and oracle router • **Independent signers**, creator-signed Create • **24 h timelocks** and an exit fee	• **Mainnet** with real Blend and DeFindex strategies • **More protocols**: XOXNO, DeFindex RWA • **Public SDK** for agent creators	• **ZK-private strategies** that still prove their rules • **Default safety layer** for agents on Stellar
